Key Takeaways

A Samoa Level 3 distribution box typically includes a welded enclosure, electrical mounting parts, busbars, cables, connecting terminals, protective devices, and labeling, designed for modular, safe, and compliant low-voltage power distribution.

Enclosure and Structure

The distribution box is housed in a welded enclosure made of cold-rolled or stainless steel, with a thickness ranging from 1. 5mm to 3mm, providing mechanical rigidity and protection against environmental factors. Doors are dual-layered, with the outer door opening up to 110° and the inner door up to 90°, often including a toughened glass observation window.

The enclosure may be wall-mounted, embedded, or floor-mounted, with flanges and slots designed for easy installation.

Electrical Mounting Parts

Inside the enclosure, electrical mounting parts support the installation of components such as busbars, circuit breakers, and control units. Components are vertically mounted, and modular compartments (unit E=25mm) allow flexible assembly and expansion. Partitions, mounting brackets, and sealing plates are added according to design requirements to ensure safety and accessibility.

Busbars and Cables

Busbars provide the main conductive paths for power distribution, while cables connect the incoming supply to downstream circuits. High-quality aluminum-zinc coated or cold-rolled steel plates are used for structural support, and connections are secured with self-tapping or hex screws. Cable entry can be from the top or bottom, facilitated by removable flanges.

Protective Devices

Level 3 distribution boxes include circuit breakers, fuses, and other protective devices to safeguard equipment and users. These devices ensure overload, short-circuit, and fault protection, complying with international standards such as IEC60439, VDE0660, BS EN60439, and NEMA. Some boxes also integrate reactive power compensation units or mixed PC/MCC circuits for industrial applications.

Labeling and Safety Features

Proper labeling identifies circuits, hazards, and operating procedures, enhancing safety and maintenance efficiency. Dual-door designs separate live and non-live parts, allowing safe operation without exposure to energized components. Enclosures may achieve IP54 or higher protection ratings, with chemical-resistant coatings for harsh environments.

Additional Features

Modern Level 3 distribution boxes may include smart monitoring, energy management, and predictive maintenance capabilities, enabling remote supervision and optimization of power flows. Modular design allows easy expansion, replacement, and integration with higher-level automation systems. In summary, a Samoa Level 3 distribution box is a modular, safe, and standards-compliant assembly consisting of a robust enclosure, mounting parts, busbars, cables, protective devices, and labeling, designed for reliable low-voltage power distribution in industrial and commercial settings.
