Low-noise solutions for high-frequency switching power supplies in the UK

Overview

One filter useful for switching spikes and other high-frequency output noise are ferrite beads. Another output noise source might be electromagnetic coupling from the outside. However, they also have one weakness unique to switching power supplies: high-frequency noise generated by switching current on and off with semiconductor elements at high speeds. The history of switching power supply technology has been synonymous with a struggle to achieve high efficiency, as. Many noise-sensitive systems use low-dropout regulators (LDOs) to provide low-noise and low-ripple power to sensitive analog circuits. But with growing current demands for these rails, designers are struggling to include LDOs because of their size, power loss, thermal rise and cost. This article is part of the TechXchange: Delving into EMI, EMC and Noise and Power Supply Design Noise is a constant problem in power-supply design.
