Cable entry conduit into distribution box

Overview

Rigid Metal Conduit (RMC) and Intermediate Metal Conduit (IMC) use fittings with external threads that screw directly into the connector or box opening. For non-metallic options, such as PVC conduit, a male adapter transitions the conduit to the electrical box. Choosing how cables enter an explosion-proof distribution box is one of those decisions that looks straightforward on paper but gets complicated fast once you factor in the actual site conditions. Only threaded entries are allowed for cable glands or conduits entering flameproof enclosures – clearance entries are not permitted. These rules define when you must install a box, how large it must be, how you must install it, and how inspectors evaluate compliance. Available as single or double row version.
