Cable tray quota with cover plate

Overview

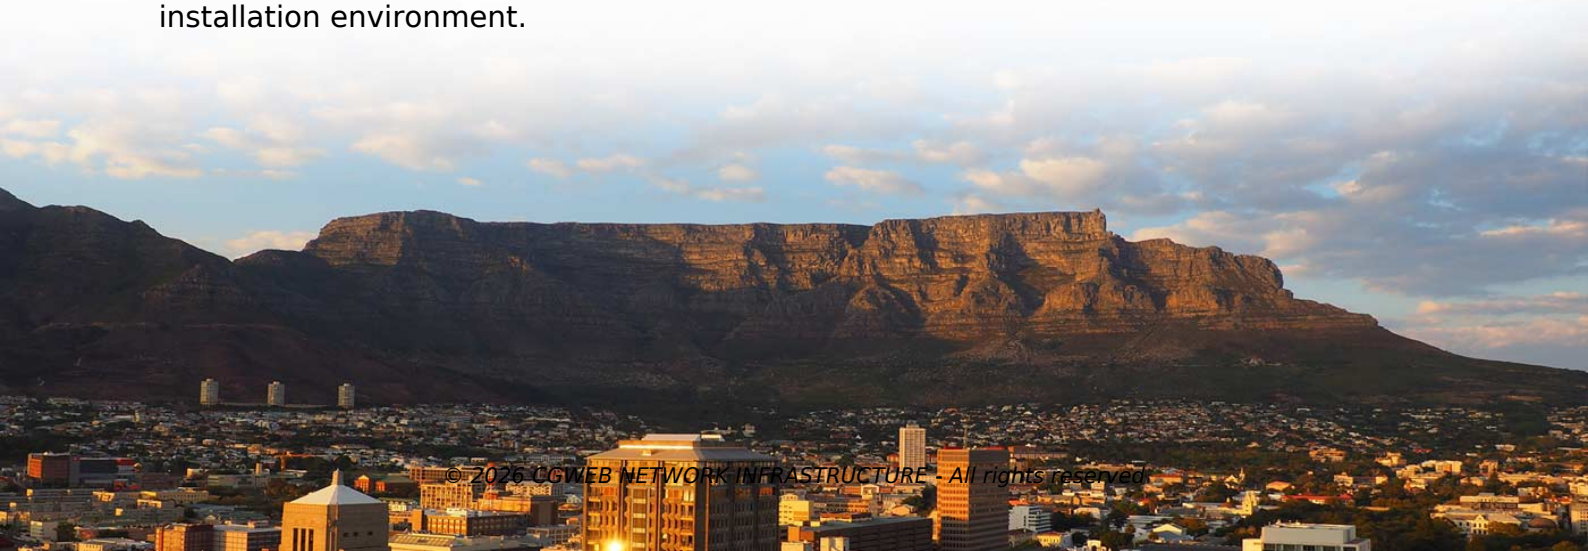

Solid flanged covers should be used when maximum enclosure of the cable is desired and no accumulation of heat is expected.

Key Takeaways

Cable tray quotations typically do not include cover plates by default; covers must be requested separately. In most cable tray systems, each section of tray and each fitting comes with splice plates and hardware, but covers are considered an additional accessory and are not automatically included in the standard quota or quote. When preparing a quotation or ordering cable trays, it is important to specify the type of cover needed—such as solid, ventilated, or hinged—because the cost and material may vary depending on the tray type and environmental requirements.

Key Points to Consider

Splice Plates and Hardware: Standard trays include splice plates and connecting hardware (1 pair per section, 2 pairs for Tees, 3 pairs for Crosses) but not covers. Cover Types: Covers can be solid, ventilated, or specialized for environmental protection, and must be explicitly requested in the quote. Material Considerations: Covers are made from the same material as the tray (aluminum, steel, or stainless steel) and may require additional finishing, such as galvanization, depending on the installation environment.

Procurement Tip: Always confirm with the supplier whether covers are included in the quote to avoid unexpected costs or installation delays. In summary, if a cover plate is required for your cable tray system, it should be explicitly included in the quotation request, as it is not part of the standard tray quota. This ensures compliance with safety, environmental, and aesthetic requirements while avoiding procurement errors.
