Composite Cable Tray Models Specifications and Dimensions

Overview

7. FRP Cable Tray Ideal for Managing and Protecting Cables FRP cable tray is the support system for managing cables and protect cables from heating, rains and corrosive elements.

Key Takeaways

Composite cable trays typically come in widths of 50–900 mm, depths of 25–150 mm, and standard lengths of 3 meters, with material thickness varying by load requirements.

Standard Widths

The width of a composite cable tray is the primary factor determining cable capacity. Standard widths range from 50 mm for small control or data cables to 900 mm for heavy industrial or large power cable installations. Narrow trays (100–150 mm) are often used for instrumentation and control wiring, medium trays (300–600 mm) for general power distribution, and wide trays (>600 mm) for data centers or utility projects where large bundles of cables are routed together.

Depth (Tray Height)Tray depth, also called side rail height, controls vertical stacking capacity and affects heat dissipation. Standard depths range from 25 mm to 150 mm, with deeper trays (75–150 mm) preferred for thick or heavy power cables, while shallower trays are suitable for light data or control cables. Proper depth ensures cables remain secure and prevents sagging or overheating.

Length

Most composite cable trays are manufactured in 3-meter (10-foot) segments, which simplifies transport, installation, and modular expansion. Longer runs can be achieved by connecting multiple segments with standard fittings.

Material Thickness

The thickness of composite trays depends on load requirements and structural support. Heavier duty trays require thicker walls and reinforced side rails to support large cable bundles, while lighter trays for data or control cables can use thinner materials. Composite materials are chosen for corrosion resistance, electrical insulation, and reduced weight compared to metal trays.

Additional Considerations

Cable Fill Ratio: Width and depth should be selected based on the total cross-sectional area of cables and the maximum fill ratio allowed by electrical codes (typically 50% for power cables in a single layer) to ensure proper ventilation and heat dissipation. Future Expansion: It is recommended to allow 20–25% extra capacity for future cable additions to avoid overcrowding and costly retrofits. Tray Type: Perforated or wire mesh composite trays are often used for data cables to improve airflow and reduce weight, while solid-bottom trays are used for heavy power cables.

By considering these dimensions and factors, engineers and facility managers can select composite cable trays that are code-compliant, structurally sound, and adaptable for future needs.

Ebo Systems

With over 60 years of expertise and innovation, the company has built a strong reputation in the field of cable and conduit management. The exceptional quality of our GRP products has been recognized

Cable Tray Dimensions Guide: Standard Sizes, Tray Types & Sizing

Explore standard sizes by tray type, understand width and depth limits, and see how to calculate and choose compliant cable tray sizes for real projects.

FRP Cable Tray Sizes and Specifications | Complete Guide

This guide walks through every specification parameter systematically — cable tray types, standard sizes and widths, load ratings, resin grades, accessories, and how to select the correct

FRP CABLE TRAY SYSTEM

Composites are materials made up of at least two different component materials, neither of which are well suited for construction purposes on their own. Combined materials however, are very sturdy and

Cable trays

We offer a wide range of cable tray systems to support tubing, electrical cables and instrumentation. Our cable trays are produced in fit for purpose materials like

Fiberglass (FRP) Cable Tray for Extreme Conditions

Made from the highest quality pultruded materials, our Fiber Reinforced Polymer (FRP) cable tray is extremely durable and resistant to chemical attack, with a proven record of performance in the most
