Construction of Dutch Tray Cable Trays

Overview

With cable duct (Tray or Lock) you ensure maximum protection and the cables are routed out of sight. Available in both closed and perforated versions.

Key Takeaways

Dutch tray cable trays are robust, modular systems designed for safe, efficient routing of power and data cables, featuring reinforced metal construction, fire resistance, and flexible installation options.

Materials and Design

Dutch tray cable trays are typically made from high-quality metals such as stainless steel (AISI 304), galvanized steel, or aluminum, providing excellent corrosion resistance and durability for industrial and commercial applications (CC Nederland B. V.),. Some systems, like those from Gouda Holland, also use glass fiber reinforced polyester (GRP) for lightweight, chemical-resistant solutions.

Tray designs include perforated, reinforced, and closed types, allowing for ventilation, cable protection, and compliance with EMC guidelines. Rounded edges and patented locking mechanisms protect cables and facilitate maintenance.

Structural Features

Dutch trays often feature double return flanges and reinforced constructions, which enhance stiffness, load capacity, and cable safety, even under heavy loads or in demanding installations. Tray lengths typically range from 3 to 6 meters, with widths from 25 mm to 600 mm and heights from 25 mm to 125 mm, with custom dimensions available. Coupling connections are integrated into fittings for quick assembly and secure fastening.

Installation and Modularity

Installation emphasizes speed, safety, and precision, often using Unilock coupling systems or integrated fasteners to ensure rigidity and electrical continuity for equipotential bonding. Dutch cable tray installers follow NEN standards and fire-rated penetration requirements, using aerial platforms or scaffolding for elevated installations. Modular components, including dividers and vertical bends, allow flexible routing and proper cable separation, supporting future expansion or reconfiguration.

Fire Resistance and Compliance

Many Dutch tray systems are fire-rated, certified according to DIN 4102-12 for E30, E60, and E90 circuit integrity, ensuring safety in commercial and industrial buildings. Systems are also supported with BIM models, Environmental Product Declarations (EPD), and technical documentation, facilitating specification, compliance, and integration into complex projects.

Applications

These cable trays are widely used in data centers, industrial plants, commercial buildings, and marine installations, providing reliable support for power, data, and control cables. Their robust construction, modularity, and compliance with safety standards make them suitable for heavy-duty and light-duty applications, including machine and skid construction. In summary, Dutch tray cable trays combine durable materials, reinforced design, modularity, and fire safety, ensuring efficient, safe, and future-proof cable management for a wide range of installations.
