# Data Center Interconnect Fiber Optic Cable Laying Frame Dimensions

## Overview

Cables can be routed into the frame from either the top or bottom, depending on specific installation requirements. Suitable for both loose bundle and ribbon-type cables.

## Key Takeaways

Fiber optic cable dimensions and layout in data center interconnects depend on trunk lengths, service loops, and rack/cabinet spacing, typically ranging from 2–3 km for campus links with careful slack management.

### Cable Lengths and Trunking

For data center interconnects, fiber optic cables are often deployed as trunks connecting patch panels across racks, cabinets, or buildings.

### Typical DC

I links are 2–3 km or shorter, with multiple single-mode fibers used to achieve high aggregate bandwidth efficiently. Trunks should be custom-built to match the exact distance between endpoints, accounting for routing paths under floors, overhead trays, or between buildings. Overestimating or underestimating lengths can lead to costly errors or signal loss.

### Service Loops and Slack Management

Service loops are essential to allow movement of patch panels and future reconfiguration. In standard server cabinets (e.g., 2 feet wide,
