H3C switch interface optical power

Overview

How To View Optical Transceiver Information On H3C SwitchesOptical transceivers are widely applied in switches, routers, network cards and other communicat.

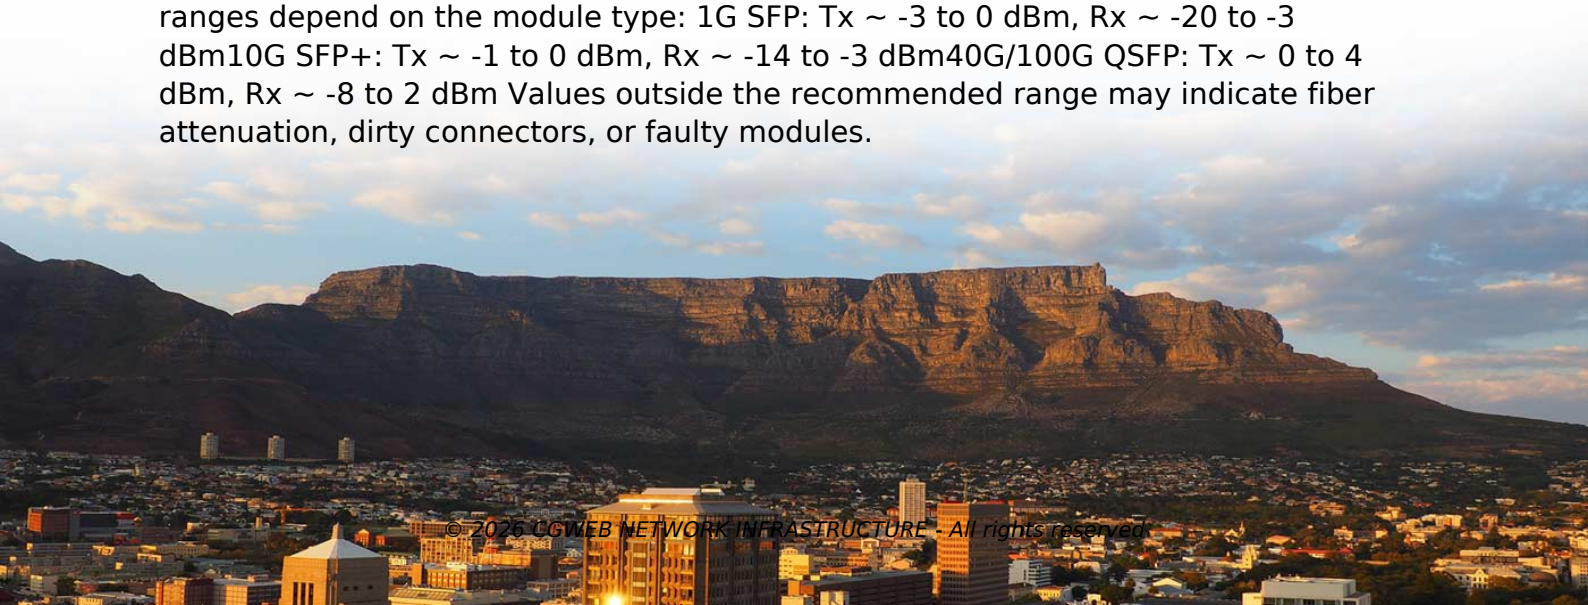

Key Takeaways

You can monitor and check optical power on H3C switches using built-in commands to view transceiver parameters and port status. Viewing Optical Transceiver InformationH3C switches support SFP, SFP+, and QSFP optical modules. To check the optical power and transceiver details: Check a specific port Use the command: display interface interface-type interface-number This shows the port negotiation speed, transceiver type, link status (UP/DOWN), and traffic statistics, which are essential for troubleshooting optical links.

View all ports at once Use: display interface brief This command lists all ports with their link status, speed, and transceiver type, allowing you to quickly identify any ports with abnormal optical power or connectivity issues.

Interpreting Optical Power

Optical transceivers report Tx (transmit) and Rx (receive) power levels. Typical ranges depend on the module type: 1G SFP: Tx ~ -3 to 0 dBm, Rx ~ -20 to -3 dBm10G SFP+: Tx ~ -1 to 0 dBm, Rx ~ -14 to -3 dBm40G/100G QSFP: Tx ~ 0 to 4 dBm, Rx ~ -8 to 2 dBm Values outside the recommended range may indicate fiber attenuation, dirty connectors, or faulty modules.

Troubleshooting Tips

Ensure the correct transceiver type is installed for the port.

H3

C switches are compatible with most standard optical modules. Check for link errors such as CRC errors, input/output errors, or high packet loss using the display interface command. Clean fiber connectors and verify cable length and type match the transceiver specifications.

For high-speed data center switches (e.g., H3C S9827 800G CPO), optical power monitoring is critical to maintain full-port 100%-line speed forwarding and low latency. Additional ResourcesH3C provides hardware manuals and online documentation for each switch series, detailing port types, supported optical modules, and power consumption.

For SM

B or access switches like the S1600V2 series, SFP+ uplinks can also be monitored similarly to ensure proper optical link performance. By regularly monitoring optical power and transceiver status, you can maintain stable network performance and quickly identify link issues on H3C switches.
