High-frequency wave trap for relay protection

Overview

A line trap, also known as wave trap, or high-frequency stopper, is a maintenance-free parallel resonant circuit, mounted inline on high-voltage (HV) AC transmission power lines to prevent the transmission of high frequency (40 kHz to 1000 kHz) carrier signals of power line. A line trap, also known as wave trap, or high-frequency stopper, is a maintenance-free parallel resonant circuit, mounted inline on high-voltage (HV) AC transmission power lines to prevent the transmission of high frequency (40 kHz to 1000 kHz) carrier signals of power line. A line trap, also known as wave trap, or high-frequency stopper, is a maintenance-free parallel resonant circuit, mounted inline on high-voltage (HV) AC transmission power lines to prevent the transmission of high frequency (40 kHz to 1000 kHz) carrier signals of power line communication to. A wave trap, also known as a high-frequency stopper, is an electronic device installed in power substations. Its main function is to block high-frequency communication signals, approximately ranging from 30 to 500 kHz, sent on the line from entering the substation equipment. They play a crucial role in Power Line.

Article Content

Wave Traps | How it works, Application & Advantages

A wave trap, also known as a high-frequency stopper, is an electronic device installed in power substations. Its main function is to block high-frequency

Performance Analysis and Parameter Optimization of a Wave Trap

stalled in substations at the terminals of transmission lines. In this study, we propose a novel protection method that utilizes high-frequency transient signals generated during fault conditions and processes

What Is a Line Trap (Wave Trap) and Why Is It

Its main job is to block high-frequency (HF) signals used for Power Line Carrier Communication (PLCC) while allowing normal 50Hz or 60Hz power

What is Line Trap or Wave Trap? Symbol, Circuit diagram

The line trap or wave trap is a device that is used to protect the switchyard equipment from high-frequency carrier signals. The wave trap is a filtering cum protective device that filters the

Inductive Line Traps | How it works, Application

Inductive line traps, also known as wave traps, are devices typically installed in power transmission lines for the purpose of blocking high frequency

SEL-T400L Time-Domain Line Protection | Schweitzer Engineering

With breakthrough time-domain technologies, the SEL-T400L Time-Domain Line Protection trips in as fast as 1 millisecond, records events with 1 MHz sampling, and locates faults accurately to the

Wave Trap Working Function & Purpose of Line Trap

That''s why it creates high impedance for high-frequency signal and low impedance for low-frequency signal. This unit prevents the high-frequency carrier signal from

Line Traps for transmission and distribution networks

Line traps are series-connected to the transmission lines, and are designed to withstand the rated power frequency current and the short circuit current to which

Power Line Carrier Communication | PLCC

The line trap or wave trap prevents unwanted loss of carrier signal power and also prevents carrier signal transmission to adjacent power lines. Line traps or wave traps are available

© 2026 CGWEB NETWORK INFRASTRUCTURE - All rights reserved

Wave Trap: Learn the Purpose, Cost, and Lead Time to

Purpose of wave trap A wave trap, also known as line trap, is a band-stop or notch filter. It blocks the high-frequency carrier signal and allows

What is Wave Trap (Line Trap) in Power Systems?

What is a Wave Trap (Line Trap) in Power Systems? A wave trap, also known as a line trap, is a key component used in high-voltage transmission

Why a wave trap is used in substations? – Mechatrofice

Protection and Control: The signals trapped by the wave trap are used for protection and control purposes. For example, they can be used to trip circuit breakers in the event of a fault.

A wave trap (also known as a line trap) is a device used in substations ...

-Facilitating Communication: High-frequency signals used for telemetry, telecontrol, or protection (like distance relays) are carried over power lines. The wave trap ensures these signals travel ...

What is a Wave Trap? – Power Line Carrier Communication

A wave trap or line trap is a device that is used to block communication signals from passing through it and only allows power signals to pass through it. The wave trap acts as a filtering

What is Wave trap or Line trap?

Line trap is a device which prevents the high-frequency carrier signals to enter the substation side. It is also known as wave trap.

ITPro Today, Network Computing, IoT World Today combine

Together, we are committed to delivering the same high-quality content and insights that have been the hallmark of ITPro Today, Network Computing, and IoT World Today.

What is Line Traps or Wave Traps ? | How Line Traps or Wave

Line traps are now made available with 600 to 1000 Om impedance over a wide band of frequencies typically from 100 to 200 kilohertz. Most of these tuned circuits allow for fine adjustment

How does a wave trap work? – WisdomAnswer

It blocks the high-frequency carrier signal and allows 60hz power frequency. A wave trap, CCVT, line tuner, and carrier relays – work hand-in-hand implementing Power Line Carrier pilot protection.
