How big is the beam splitter line

Overview

What are Beamsplitters?

Beamsplitters are optical components used to split incident light at a designated ratio into two separate beams. Additionally, beam.

Key Takeaways

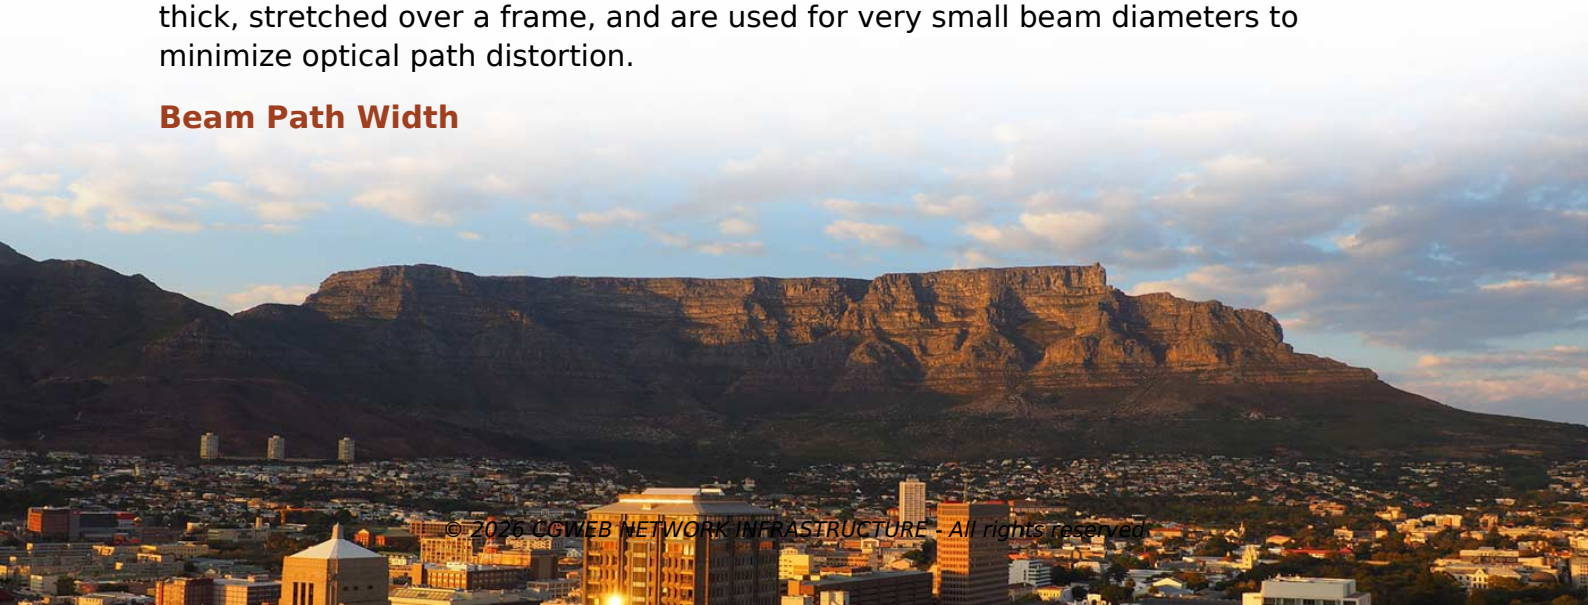

The size of a beam splitter line depends on the type of beam splitter and the optical setup, typically ranging from a few millimeters to several centimeters in width.

Physical Dimensions of Beam Splitters

Beam splitters come in several forms, including cube, plate, and pellicle types. Cube beam splitters are usually made from two right-angle prisms cemented together, forming a cube with sides commonly ranging from 5 mm to 50 mm or larger for specialized applications. Plate beam splitters are thin glass plates, often 1–10 mm thick, with lateral dimensions from 10 mm up to 50 mm or more, depending on the manufacturer and intended laser beam size.

Pellicle beam splitters are extremely thin membranes, typically a few micrometers thick, stretched over a frame, and are used for very small beam diameters to minimize optical path distortion.

Beam Path Width

The "beam splitter line" can also refer to the width of the light beam that passes through or is reflected by the splitter. This is determined by the incident beam diameter and the aperture of the splitter. Standard laboratory beam splitters accommodate beams from 1 mm to 25 mm in diameter, while high-power or industrial laser systems may require splitters with apertures exceeding 50 mm.

The effective beam width must be smaller than the clear aperture of the splitter to avoid clipping and maintain uniform splitting ratios.

Customization and Applications

Beam splitters can be custom-sized for specific optical setups. For example, in interferometers or laser projection systems, the splitter may be designed to match the beam profile exactly. Manufacturers like Thorlabs and Newport offer custom cube and plate beam splitters with precise surface flatness and high-quality coatings to handle high-power laser beams without distortion.

Summary

Cube beam splitters: 5–50 mm per sidePlate beam splitters: 10–50 mm lateral, 1–10 mm thickPellicle beam splitters: micrometer-thick membranesBeam path width: typically 1–25 mm, can be larger for industrial applications The exact "beam splitter line" size depends on the type of splitter, the beam diameter, and the optical system requirements.

Article Content

What are Beamsplitters?

Beamsplitters are optical components used to split incident light at a designated ratio into two separate beams. Additionally, beamsplitters can be used in reverse to combine two different beams into a

Beam Splitters – optical power splitter, beamsplitter, thin-film ...

Beam splitters are devices for splitting a laser beam into two or more beams. There are different types, including polarizing and non-polarizing versions.

Laser Line Polarizing Cube Beamsplitters

Laser line polarizing cube beamsplitters provide efficient, narrowband polarization for higher power lasers. Their extinction ratio is better than 1000:1, and they are recommended for use in pulsed laser

Beam Splitter Selection Guide

An Optical Beamsplitter is an optic or optical device that is used to split a beam of light in two. Newport offers a wide variety of Beamsplitters in various shapes.

Physics:Beam splitter

Beam splitters are sometimes used to recombine beams of light, as in a Mach–Zehnder interferometer. In this case there are two incoming beams, and

Beam Splitters — Abridged Guide

Cube beam splitters provide equal optical path lengths for both output beams — important for interferometry. Plate beam splitters require a compensation plate in one arm to match path lengths.

OptoSigma

Beamsplitters are used to separate the light by a ratio of power between transmitted and reflected beams but can also be used to separate polarization states or different wavelenths of light.

Beamsplitters | Coherent

These are plate beamsplitters nominally designed for use at 10.6 µm at 45° angle of incidence. They can be supplied in various diameters and thicknesses, and with a wide range of different reflectance and

Thorlabs · Optical Beamsplitters

Thorlabs offers a wide range of optical beamsplitters. Our plate beamsplitters have a coated front surface that determines the beam splitting ratio while the back surface is wedged and AR coated in

What are Beamsplitters?

Beamsplitter Construction | Types of Beamsplitters Beamsplitters are optical components used to split incident light at a designated ratio into two separate beams. Additionally, beamsplitters can be used

What is a Beam Splitter?

A beam splitter or power splitter is an optical device that can split an incident light beam e.g. a laser beam into two or sometimes more beams, which may or may not have the same optical

Beam Splitter

A conventional beam splitter is an optical component used to divide an incident beam into two or more beams by refracting or reflecting it. In contrast, artificial nanostructures of metasurfaces provide

Beam Splitters: Explained

© 2026 CGWEB NETWORK INFRASTRUCTURE - All rights reserved

Beam splitters are a fundamental element in optical systems. Beam splitters are, in essence, optical components used to divide a single light source (usually a laser) into two separate

Beam Splitter

The coherent states, impervious to entanglement when they are coupled to a single beam splitter, keep this remarkable property when a large set of beam-splitters couples them to a big environment.

Fundamental properties of beam-splitters in classical and quantum optics

Abstract. A lossless beam-splitter has certain (complex-valued) probability amplitudes for sending an incoming photon into one of two possible directions. We use elementary laws of classical and

Laser Line Beam Splitter

Laser Line Beam Splitter FOR SPLITTING INTO ONE OR MORE DEFINED PARTIAL BEAMS. When working with lasers, it is often necessary to split a laser beam into two or more defined partial beams.

Beam splitter

A beam splitter or beamsplitter is an optical device that splits a beam of light into a transmitted and a reflected beam. It is a crucial part of many optical experimental

Covering the Basics of Beamsplitters — Firebird Optics

Polarizing Beamsplitter While standard non-polarizing beamsplitters divide light by wavelength, a polarizing beamsplitter will split the incident beam
