How to check the optical port on a switch

Overview

How To View Port Status And Optical Module Information On Cisco By reading internal parameters of optical transceivers on switches, users can monitor link.

Key Takeaways

You can determine if a switch port is optical by checking the installed transceiver type, port status, and interface details using CLI commands like show inventory, show interface status, and show interfaces transceiver detail. Step 1: Check Installed ModulesUse the command show inventory to list all installed hardware and transceivers. This will display the type of SFP, SFP+, GBIC, or QSFP module installed on each port, including part numbers and serial numbers.

If a fiber SFP is present, the port is optical; if a copper module (like GLC-TX) is installed, it is electrical. Step 2: Inspect Interface StatusRun show interface status to see the port type, speed, and link status. Ports labeled with “10/100/1000TX” typically indicate copper Ethernet, while ports showing SFP or fiber-related identifiers suggest optical connectivity.

Step 3: Detailed Transceiver DiagnosticsFor deeper verification, use:show interfaces transceiver detail or show interface transceiver detail to read DOM/DDM values such as Tx/Rx power, temperature, and voltage.show idprom interface or show idprom transceiver extended to read EEPROM information including vendor, part number, and wavelength. These commands confirm whether the port is optical and provide operational diagnostics for troubleshooting. Step 4: Check Line Card or Module TypeSome line cards are purely optical, while others support both copper and fiber.

Use show module to identify the type of line card installed. This helps determine if a port can support optical connections even if no SFP is currently inserted.

Summary

To verify if a switch port is optical: Use show inventory to identify installed SFPs or transceivers. Check show interface status for port type and speed. Use transceiver detail commands for diagnostics and confirmation.

Inspect the line card type with show module to understand port capabilities. Following these steps ensures accurate identification of optical ports and helps in troubleshooting or planning network upgrades.
