

How to connect the Ethernet ports of the core switch

Overview

Take one end of the Ethernet cable and insert it firmly into an available Ethernet port on the switch. Then, connect the other end of the cable to an available Ethernet port on the router.

Key Takeaways

Yes, a core switch can be connected to an Ethernet port, either via standard RJ45 copper connections or through SFP/fiber modules, depending on the switch capabilities and network requirements.

Core Switch Connectivity

A core switch serves as the central aggregation point in a network, handling high-volume traffic, inter-VLAN routing, and connections to enterprise networks or other distribution switches. While core switches often use high-speed uplinks like SFP or fiber for redundancy and bandwidth, they can also be connected using standard RJ45 Ethernet ports for copper connections, especially in lab setups or smaller networks.

Port Types and Options

RJ45 Ports: Standard copper Ethernet ports suitable for 1G or 10G connections, commonly used for access-layer or short-range uplinks.

SFP/SFP+ Ports: Flexible ports that can accept either fiber or copper transceivers, supporting 1G to 10G speeds. These are often used for uplinks to other core or aggregation switches.

QSFP/QSFP28 Ports: High-density ports for 40G or 100G connections, typically used in data center spine-leaf architectures.

Many core switches support a combination of these ports, allowing connections via copper RJ45 or fiber SFP modules depending on distance, bandwidth, and redundancy requirements.

Practical Considerations

Bandwidth and Redundancy: Core switches usually handle high traffic, so using higher-speed ports (SFP/SFP+) is preferred for uplinks to avoid bottlenecks. **Cabling:** For copper connections, standard Ethernet cables (Cat5e/Cat6/Cat6a) can be used. In some cases, crossover cables may be required if connecting two switches directly, though modern switches often support auto-MDI/MDIX.

Logical Configuration: Regardless of physical port type, the connection functions as an Ethernet link.

VLA

Ns, trunking, and Layer 3 routing configurations remain the same whether using RJ45 or SFP.

Summary

You can connect a core switch to an Ethernet port using either RJ45 copper or SFP/fiber connections. The choice depends on network speed requirements, distance, and redundancy considerations. For small networks or lab environments, RJ45 connections are sufficient, while production networks often use SFP or higher-speed uplinks to ensure performance and reliability.
