How to sort data on a terminal box

Overview

The syntax for the sort command is as follows: sort . If no file is specified, sort reads from standard input. Whether you're dealing with log files, lists, or raw data, sort helps you arrange information in a meaningful order—alphabetically, numerically, by column, and more. Sorts the contents of a text file, line by line. When sort reads the input, it compares each line. I run into sorting problems more often than I expect: a build pipeline that suddenly processes jobs out of order, a log export where “10” appears before “2”, a CSV report that needs to be grouped and ranked, or a quick audit where I want “unique values, alphabetized” without opening a. I have written a shell script that gets all the file names from a folder, and all its sub-folders, and copies them to the clipboard after sorting (removing all paths; I just need a simple file list of the thousands of randomly named files within).
