Is the door access box considered a distribution box

Overview

A distribution box (DB) is a type of electrical enclosure specifically designed for the distribution of electrical power.

Key Takeaways

A door access box is not the same as a distribution box; they serve different purposes in electrical and access control systems.

Distribution Box

A distribution box (also called a DB box or power distribution box) is an enclosure designed to safely distribute electrical power from a main supply to multiple circuits. It typically contains circuit breakers, fuses, bus bars, and sometimes residual current devices (RCDs) to protect against overloads, short circuits, and electrical faults, ensuring safety for both people and equipment. Distribution boxes can be indoor or outdoor, made from metal or plastic, and are used in residential, commercial, and industrial settings.

They may be fixed or portable, with portable versions often used for temporary setups like construction sites or events.

Door Access Box

A door access box, on the other hand, is part of an access control system. Its primary function is to manage and control electronic door locks, card readers, keypads, or biometric devices. It houses control circuits, relays, and sometimes power supplies that operate the door locking mechanisms.

Unlike a distribution box, a door access box does not distribute general electrical power to multiple circuits; instead, it focuses on security and access management for doors or gates. They are not interchangeable and are designed for distinct purposes in electrical and security systems.
