# Spacing between distribution box and fire extinguisher box

## Overview

NFPA 10 placement rules — travel distance limits, mounting height, signage, and spacing by hazard class.

## Key Takeaways

Fire extinguishers should be installed at a safe, accessible distance from electrical distribution boxes, ensuring compliance with NFPA 10 and avoiding obstruction or electrical hazards. Key Guidelines for Placement1. Maximum Travel Distance: NFPA 10 specifies that the maximum travel distance to a fire extinguisher depends on the hazard type.

For Class C hazards (energized electrical equipment), the travel distance should generally not exceed 30 to 50 feet (9. 1 to 15. 25 meters) along normal walking paths, measured from any point in the area to the extinguisher.

This ensures that the extinguisher is quickly accessible in an emergency. 2. Clearance from Electrical Equipment: Fire extinguishers should not be mounted directly on or immediately adjacent to energized electrical panels or distribution boxes.

A minimum clearance of 3 feet (0. 9 meters) from the front of the panel is recommended to allow safe access to both the panel and the extinguisher. This prevents interference with electrical maintenance and reduces the risk of electrical shock during use.

3. Mounting Height: Extinguishers should be mounted so that the carrying handle is 3. 5 to 5 feet (1.

1 to 1. 5 meters) above the floor, depending on the extinguisher weight, ensuring easy reach without obstruction. 4.

Visibility and Accessibility: The extinguisher must be clearly visible and unobstructed. Avoid placing it behind doors, equipment, or storage that could block access. Signage may be required to indicate the extinguisher location if it is not immediately visible.

5. Hazard Considerations: Since distribution boxes are considered Class C hazards, ensure the extinguisher is rated for electrical fires (Class C or ABC). The extinguisher should be positioned so that a person can approach safely without standing directly in front of live electrical components.

### Practical Recommendation

Place the fire extinguisher at least 3 feet away from the distribution box horizontally, ensuring the path to the extinguisher is clear. Ensure the maximum travel distance from any point in the room to the extinguisher does not exceed 50 feet for electrical hazards. Mount the extinguisher at a height that allows quick access and does not interfere with panel operation.

Use proper signage if the extinguisher is not immediately visible from the main access points. By following these guidelines, the fire extinguisher will be both accessible and safe, meeting NFPA 10 requirements while minimizing risk near electrical distribution equipment.
