Steps for making an optical fiber splice closure

Overview

Installation Guide for Fiber Optic Splice ClosureInstalling a fiber optic splice closure efficiently and effectively requires attention to detail and adher.

Key Takeaways

An optical fiber splice closure typically consists of a closure body, splice trays, sealing elements, cable glands, and mounting brackets, all designed to protect and organize fiber splices.

Main Components

Closure Body: The primary housing that protects the spliced fibers from environmental factors such as moisture, dust, and temperature variations. It can be made of high-strength engineering plastics or metal and is designed to be weather-resistant and durable. Splice Trays: These hold and organize individual fiber splices, providing mechanical support and protection.

Each tray can accommodate multiple fibers (commonly up to 24 per tray) and allows for neat coiling of excess fiber to prevent bending or damage. Sealing Elements: Rubber gaskets, O-rings, or self-adhesive strips ensure the closure is watertight and dustproof. Proper sealing prevents environmental damage and maintains the integrity of the optical signal.

Cable Glands and Clamps: These provide entry points for fiber optic cables and secure them in place. They accommodate different cable diameters and may include metal or plastic clamps to fix armored layers and strength members, ensuring strain relief and proper grounding. Mounting Brackets: Used to attach the closure to poles, walls, or other structures.

They provide stability and allow for easy access during maintenance or expansion. Grounding and Bonding Components: For cables with metallic shielding or strength members, grounding inserts or bonding devices are included to safely discharge electrical currents and prevent damage. Optional Features: Some closures include integrated patch panels or connector adapters for FTTH networks, midspan access ports, or hybrid designs combining splicing and patching capabilities.

Additional Considerations

Heat Shrink or Mechanical Protection Tubes: After splicing, fibers are often protected with heat shrinkable tubes or mechanical sleeves to reinforce the splice point. Stacked or Modular Tray Design: Allows for expansion and easy organization of multiple fibers within the same closure. Cable Entry Configurations: Dome closures typically have all cables entering from one end, while inline closures allow entry from both ends, depending on the application.

These components work together to ensure that fiber optic splices are secure, organized, and protected, maintaining network performance and reliability over time. Proper installation and adherence to manufacturer guidelines are critical for effective sealing, strain relief, and fiber management.
