Unstable optical port on the switch

Overview

Connect a known-good device directly to the problematic port on the switch. There are no specific requirements for this document. This document applies to Catalyst switches that run on Cisco IOS® System Software. The information in this document was created from the devices in a specific. Network switches, as the core of data forwarding in enterprise LANs, are key nodes that ensure interconnection between endpoints and stable transmission of business data. Their failures may originate from physical layer connection anomalies or may be caused by logical configuration and hardware. This document describes how to troubleshoot fiber optic interfaces by addressing some of the fiber optic module and cabling specifications. Whether you are dealing with a no link light, intermittent connectivity (link flapping), or a transceiver not detected error, the root cause is often not immediately obvious. Major causes of the interface physically down event include hardware and software failures. The transmit or receive optical power of an optical module is not within the normal range.
