Venezuela Fiber Optic Heat Shrink Tube Fixing and Installation Scheme

Overview

This document provides installation instructions for a dome heat shrinkable seal fiber optic splice closure (FOSC).

Key Takeaways

Fiber optic heat shrink tubes in Venezuela should be installed using proper FOSC procedures, ensuring secure splicing, environmental sealing, and mechanical protection.

Overview of Heat Shrink Tubing

Heat shrinkable tubing, such as the COMPAQ CFOT Series, is designed for fiber optic splice closures (FOSC) to provide watertight and gastight seals, protecting fibers from environmental and mechanical damage. These tubes are made from cross-linked polyolefin with an internal polyamide hot-melt adhesive, offering UV stability, corrosion resistance, and high mechanical strength, suitable for outdoor, underground, and exposed environments ( ).

Preparation and Tools

Site Preparation: Clean the installation area and ensure protection from dust, moisture, and adverse weather. If necessary, use a tent or cover for waterproofing ( ).
Tools Required: Fiber cleaver, splicing machine, tweezers, heat gun, and FOSC-specific accessories.

Operators must provide their own testing instruments ( ). Cable Handling: Avoid excessive pulling, bending, or crushing. Maintain the minimum bend radius and prevent kinks to preserve transmission quality ( ).

Installation ProcedureFOSC Preparation: Open the closure by removing the hoop fixing bolt and pulling the cover upwards ( ). Fiber Routing: Reserve sufficient fiber length (>1. 6 m) and maintain a curved radius >30 mm inside the splice tray (FOST) to prevent attenuation ( ).

Splice Protection: Insert fibers into heat shrink splice sleeves. Ensure fibers are centered before heating; clear sleeves allow visual alignment ( ). Heat Shrinking: Apply heat evenly using a heat gun until the tubing shrinks and the adhesive melts, forming a secure moisture and gas seal ( ).

Mechanical Fixing: Secure the FOSC and fibers using the provided hoops and clamps. Ensure the closure withstands a bearing pull ≥800 N without breakage ( ).

Environmental and Safety Considerations

Ambient temperature range: –40°C to +65°C ( ). Ensure no air bubbles remain after sealing; test by immersing in water at normal temperature for 15 minutes and observing for 24 hours ( ). Handle cleaved fibers carefully to avoid injury; use tweezers and dispose of fragments safely ( ).

Avoid direct exposure to laser light from active fibers, as it can cause retinal damage ( ).

Key Recommendations

Use medium-wall heat shrink tubing with hot-melt adhesive for reliable sealing. Maintain proper fiber slack and bend radius inside the FOSC. Verify closure integrity with air pressure testing and mechanical stress checks.

Follow manufacturer-specific drawings for branch or straight-through splicing ( ). By following these steps, fiber optic heat shrink tubes can be securely installed in Venezuela, ensuring long-term performance, environmental protection, and mechanical stability.
