What does it mean if a network cable has a pigtail

Overview

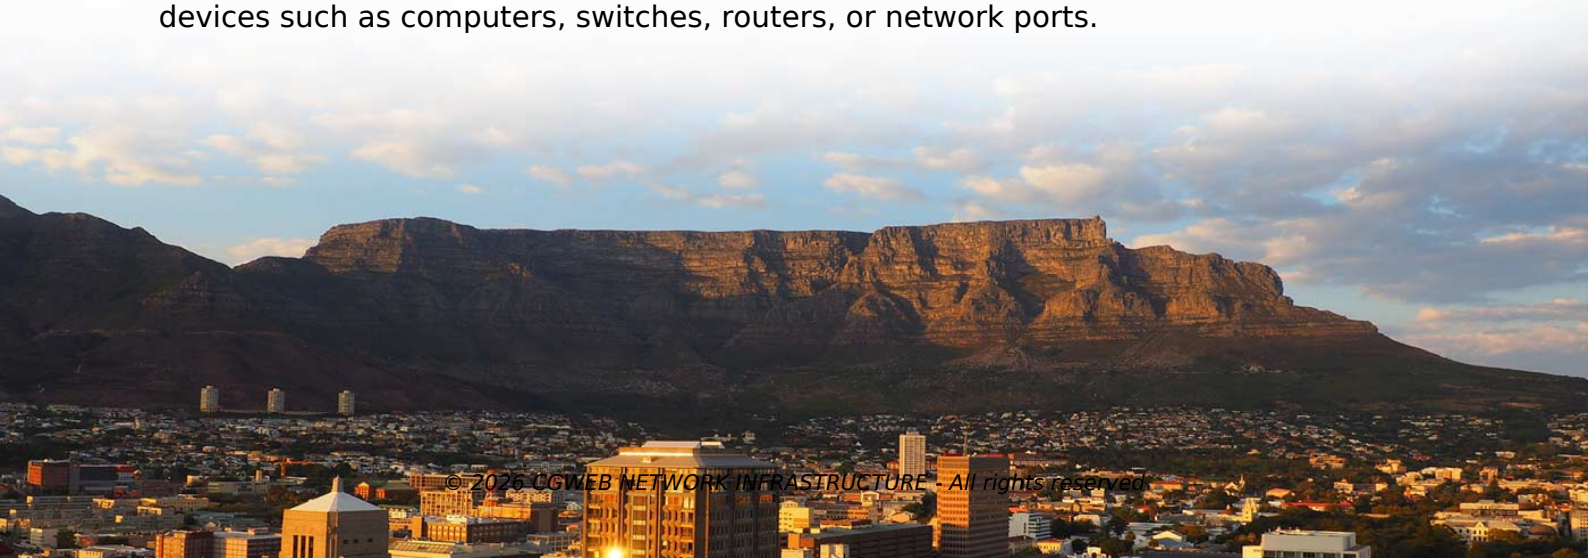

A pigtail is a short fiber with a factory-polished connector on one end and bare fiber on the other.

Key Takeaways

A pigtail is not the same as a network cable; it is a short, single-ended fiber optic cable used for splicing, while a network cable (patch cable) connects devices with connectors on both ends. What is a Pigtail? A pigtail is a short fiber optic cable with a pre-attached connector on one end and a bare or stripped fiber on the other end.

The bare end is designed to be fusion-spliced to a longer fiber optic cable inside a distribution frame, terminal box, or splice tray. Pigtails are typically short, around 1–3 meters, and are used to create low-loss, serviceable connections at network termination points or splicing locations. They are essential for fiber optic networks where precise, factory-polished connectors are required to maintain signal quality and minimize loss.

What is a Network Cable? A network cable, often called a patch cable or patch cord, is a flexible cable with connectors on both ends. These cables are used to connect devices such as computers, switches, routers, or network ports.

Network cables can be copper-based (e.g., Cat5, Cat6, Cat6a) for electrical signals or fiber optic for optical signals. They vary in length, typically from a few centimeters to several meters, and are designed for device-to-device connectivity within a network. Pigtails are primarily for terminating and splicing fiber optic cables, providing a precise connector interface, whereas network cables are for directly connecting devices in a network. Understanding this distinction is crucial for proper network installation and maintenance.
