What size is suitable for an industrial secondary power distribution box

Overview

In this guide, I''ll walk you through a practical, step-by-step process to size your distribution box based on actual load current.

Key Takeaways

Industrial secondary power distribution boxes typically range from compact enclosures for 8–32 circuits to larger modular panels, with dimensions varying based on load, number of feeders, and environmental requirements.

Typical Sizes and Configurations

Industrial secondary distribution boxes are designed to accommodate branch circuits, control devices, and busbars. Standard configurations often include: Small to medium boxes: Suitable for 8–32 elements or circuits, often used for localized distribution in factories or workshops (e.g., Solera IP65 boxes). Modular panelboards: Can handle higher currents and multiple feeders, with rated currents up to 630A and breaking capacities around 20kA, housed in robust 2mm sheet steel enclosures (e.g., Eaton XBoard series).

Custom enclosures: For specialized industrial applications, sizes can be tailored to house PLCs, relays, contactors, and other control equipment, with flexibility for future expansion.

Factors Affecting Size

Number of circuits: More outgoing feeders require larger enclosures to accommodate breakers and busbars. Rated current and busbar size: Higher current ratings necessitate thicker busbars and more spacing, increasing enclosure dimensions. Environmental protection: IP65–IP69K enclosures for outdoor or washdown areas may require additional space for seals and cable glands.

Material choice: Metal enclosures provide structural strength and EMI shielding, while polymer enclosures are lighter and corrosion-resistant, which can influence overall size.

Practical Examples

Compact IP65 boxes: Typically around 300–600 mm in height, 200–400 mm in width, and 150–300 mm in depth for 8–32 circuits. Medium industrial panels: Can range from 600–1200 mm in height, 400–800 mm in width, and 200–400 mm in depth, supporting higher currents and multiple feeders. Large modular switchboards: Customizable dimensions exceeding 2 meters in height and width for complex industrial power distribution.

Summary

The size of an industrial secondary power distribution box depends on circuit count, current rating, environmental protection, and enclosure material. Standard small boxes handle 8–32 circuits, medium panels support higher currents up to 630A, and large modular systems are fully customizable. Selecting the right size ensures safety, compliance, and future expandability in industrial power distribution systems.
